## Overview

Design of the Electric Vehicle (EV) battery pack involves different requirements related to the driving range, acceleration, fast-charging, lifetime, weight, volume, etc. Therefore, sizing of the EV battery pack necessitates. ••Hybrid battery system tackles the poor design trade-off achievable with. BMS Battery Management SystemC-rate Charge or discharge current divided by nominal capacity. Lithium-ion (Li-ion) batteries are mostly designed to deliver either high energy or high power depending on the type of application, e.g. Electric Vehicles (EVs) or Hybrid EVs (HEV). The proposed model-based design optimization framework is illustrated in Fig. 1. In the first step, the EV driving cycles should be converted to appropriate battery pack duty cycles. The architecture of the hybridization determines how the HE and HP packs will interface with each other as well as with the DC-link of the motor drive. This is important since it can impose. As illustrated in Fig. 1, the multi-objective optimizer is needed to obtain the optimal sizing of the hybrid battery pack. The optimizer sends selected hybrid battery configurations to.
