

Solar Photovoltaic Panels PN Section

Overview

A PN junction is simply the boundary formed when a P-type and an N-type semiconductor are joined together, creating a depletion region and a built-in electric field that separates charges. This internal electric field is what makes solar cells generate electricity. What Exactly Is a PN. Have you ever wondered how shining sunlight on a solar panel creates electricity?

It is, unsurprisingly, quite a complex operation. It's called the photovoltaic (PV) effect, and in this article I will try and explain it as simply as I can. When these two types of materials are combined, they form a junction where an. Meaning → Junction Formation denotes the convergence of disparate energy flows, material cycles, and socio-economic systems to establish resilient and regenerative infrastructure. Meaning → Junction Electric Field is the intense, static electric field that spontaneously forms across the depletion. Suppose that a Si crystal plate is p-type on one side, and n-type on the other, and at some depth below the surface the two types get in contact – what's created then is a so-called p-n junction (some people prefer calling it n-p junction, which is essentially the same).
