

The upper limit of the photovoltaic panel rating

Overview

At 25°C, solar panels achieve their rated maximum power output. This temperature represents the peak efficiency point where the semiconductor materials in photovoltaic cells function optimally, balancing electron mobility with minimal thermal interference. The NEC 120% rule is a safety limit that governs how much backfed solar current you can add to a panelboard without overheating the busbar. If you design or sell PV, understanding this rule is essential to pass plan review, avoid field change orders, and ensure long-term reliability. Follow it, and you've got a. The optimal solar panel operating temperature is 25°C (77°F) under standard test conditions. However, practical performance considerations reveal a more nuanced picture. As of 2025, the best reached 24. Let's provide a simpler explanation. You input sunlight, and you expect.
